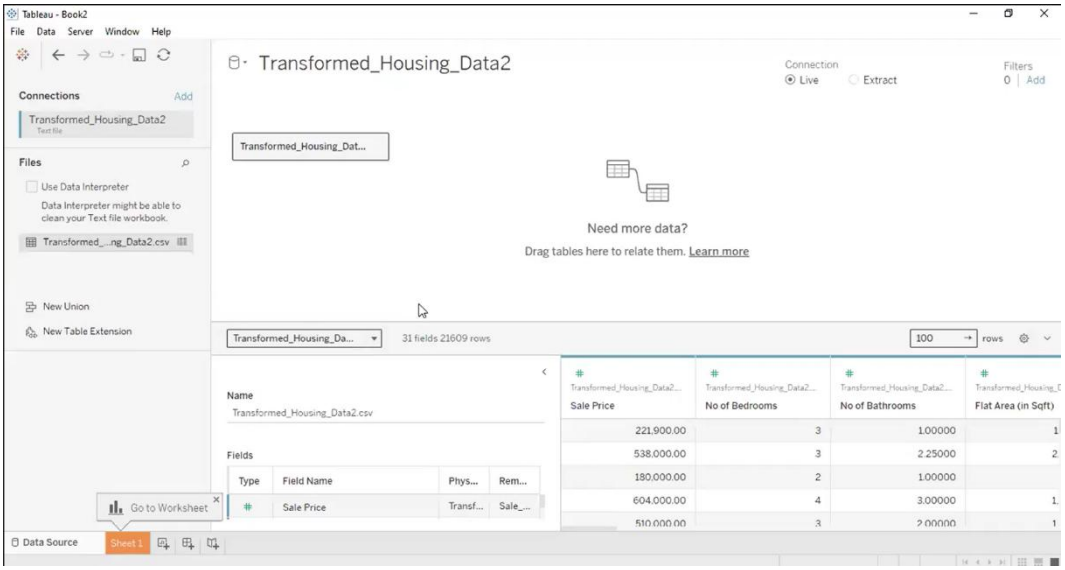
1. Data Connectivity

The House marketing dataset was connected to Tableau Desktop using a CSV/Excel file. The data source was verified for correct field types (Year as dimension, Number of houses as measure, State as dimension etc.). Live connection mode was used for dashboard creation.



2.Data Preparation

Before creating the dashboard, several preprocessing steps were performed to ensure data accuracy and consistency. Duplicate records were checked and removed where necessary. Missing or null values were identified and handled appropriately. Column names were standardized to improve clarity and consistency.

Data types were verified to ensure correct aggregation during analysis. The Year field was formatted correctly, and the Number of Manufacturers field was confirmed as a numeric measure.

Several calculated fields were created in Tableau to enhance analytical capabilities. These included fields to identify the Peak Year (year with maximum floors), Peak Year Value (maximum housees count), Total Manufacturers (sum of all areas), Total States (distinct count of states).

	A	B	C	D	E	F
1	Sale_Price	No of Bed	No of Batl	Flat Area (	Lot Area (i	No of Floo
2	221900	3	1	1180	5650	1
3	538000	3	2.25	2570	7242	2
4	180000	2	1	770	10000	1
5	604000	4	3	1960	5000	1
6	510000	3	2	1680	8080	1
7	1129575	4	4.5	5420	101930	1
8	257500	3	2.25	1715	6819	2
9	291850	3	1.5	1060	9711	1
10	229500	3	1	1780	7470	1
11	323000	3	2.5	1890	6560	2
12	662500	3	2.5	3560	9796	1
13	468000	2	1	1160	6000	1
14	310000	3	1	1430	19901	1.5

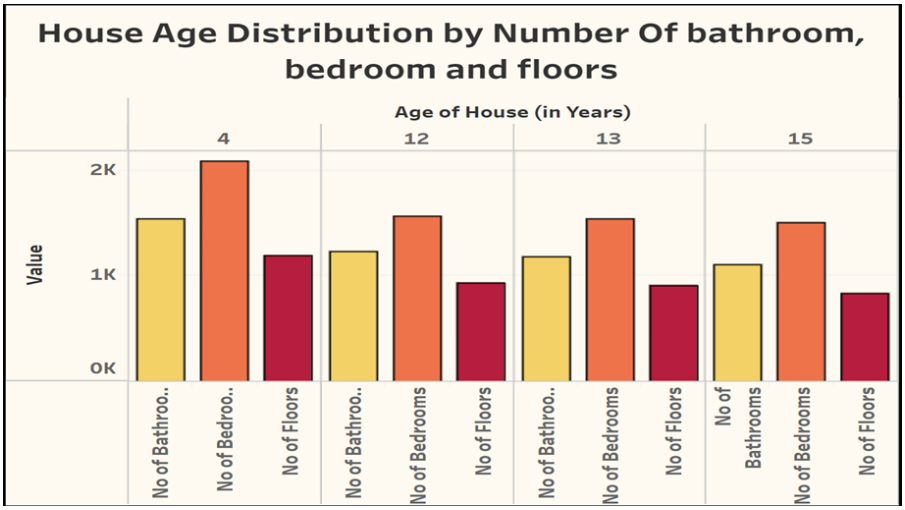
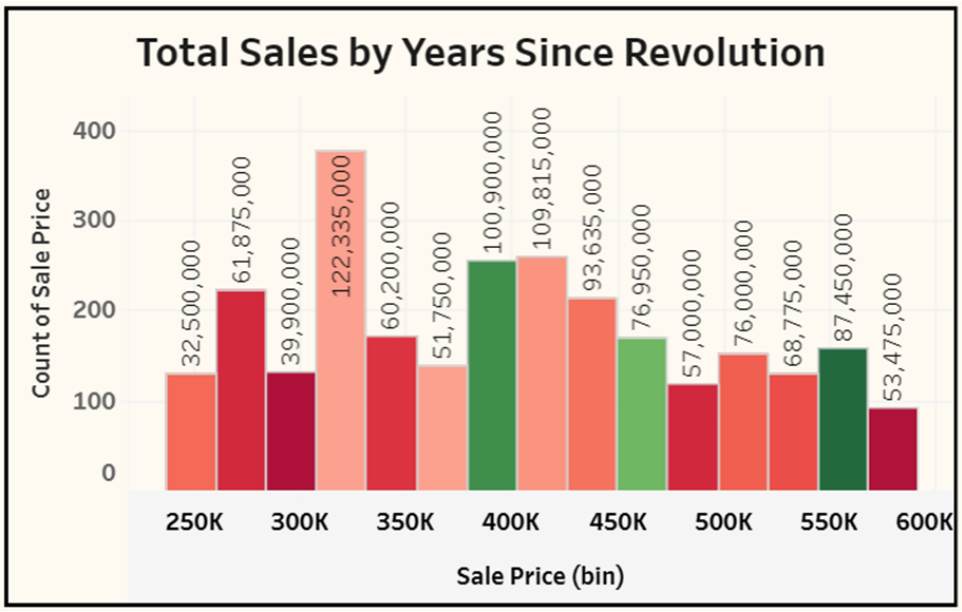
28	937000	3	1.75	2450	2691	2
29	667000	3	1	1400	1581	1.5
30	438000	3	1.75	1520	6380	1

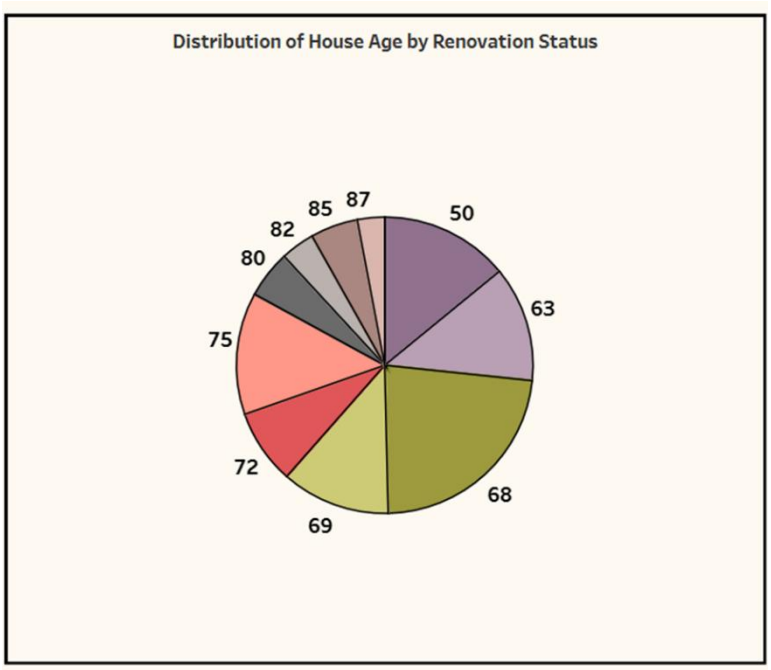
3.Business Questions Addressed

The dashboard was developed to answer key analytical questions such as:
Which year recorded the highest number of house purchases?
This is Bar Chart for the Analysis if age distributions of number of bathrooms, floors and doors on entire dataset



This is the Area Chart which is used for analysis of number of Sales by Year.





This Pie Chart is about the Analysis of House Age by Renovation
